Captive Screws - Countersunk

hex. socket

Material
- Stainless steel (A2-70, AISI 303).
- Also available on request in steel (anodised, black oxide or zinc plated) stainless steel (A4, AISI 316), brass, aluminium etc.

Technical Notes
- Generally to DIN 7991.
- Often used with our captive washers (36691) or retaining flanges (36692 - for sheet metal applications).
- The M2 and M2.5 sizes have a 0,5mm land on the head.

Captive Screws - Countersunk

hex. socket

Material
Stainless steel (A2-70, AISI 303). Also available on request in steel (anodised, black oxide or zinc plated) stainless steel (A4, AISI 316), brass, aluminium etc.

Technical Notes
Generally to DIN 7991. Often used with our captive washers (36691) or retaining flanges (36692 - for sheet metal applications). The M2 and M2.5 sizes have a 0.5mm land on the head.
Coatings and drive types

Coatings

Wixroyd produce a wide range of fasteners designed for application where it is important that fasteners are not separated from equipment (e.g. cover panels etc). This is now important to ensure that equipment complies with Machinery Directive 2006/42/EC - requiring that fasteners remain attached to fixed guards or equipment when guards are removed.

Our captive panel screws are manufactured mainly from stainless steel (A2, AISI 303 grade), but they can also be produced in stainless steel (A4, AISI 316), aluminium, brass or zinc plated steel.

Many finishes can be applied - black oxide finish, anodizing etc.

The main options are as follows:

<table>
<thead>
<tr>
<th>Finish</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Black Chrome (MIL-C-1458B)</td>
<td>Black chrome is a hard, non-reflective coating which is resistant to abrasion, heat and corrosion. The black chrome surface is a dull, dark grey and may be waxed or oiled to darken surface.</td>
</tr>
<tr>
<td>Black Oxide Coating (MIL-C-13924B)</td>
<td>Black oxide is a uniform black coating for ferrous metals. Generally it is considered a decorative coating and provides only very limited corrosion protection under mild corrosion conditions.</td>
</tr>
<tr>
<td>Cadmium</td>
<td>Cadmium is a bright, silvery white plating. Supplementary treatments for Type II can be golden, iridescent, amber, black or olive drab.</td>
</tr>
<tr>
<td>Passivate (QQ-P-35/MIL S-500SC)</td>
<td>Passivation is a process designed to remove foreign metals from the surface of stainless and corrosion resistant steels.</td>
</tr>
<tr>
<td>Phosphate Coating Light (TT-C-00490B)</td>
<td>Phosphate coating is a light coating for use as a base paint.</td>
</tr>
<tr>
<td>Gold (MIL-G-45204B)</td>
<td>Yellow to orange colour depending on proprietary process used. Will range from matt to bright finish depending on base metal. Good corrosion resistance and high tarnish resistance.</td>
</tr>
<tr>
<td>Nickel (QQ-N-290A)</td>
<td>Nickel is a corrosion protective plating for steel, zinc and zinc alloys as well as copper and copper alloys.</td>
</tr>
<tr>
<td>Zinc (QQ-Z-325C)</td>
<td>The primary use of chromate finishes on zinc is to retard or prevent formation of white corrosion products on zinc surfaces.</td>
</tr>
</tbody>
</table>

Drive types

<table>
<thead>
<tr>
<th>Schematic</th>
<th>Drive Types</th>
<th>Uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hexagonal recess</td>
<td>Ideal for precision assembly. Most recommended where less surface area is available.</td>
<td></td>
</tr>
<tr>
<td>Crosshead (Phillips®)</td>
<td>Provides good control in driving. Always use a driver bit of the proper size which is in good condition.</td>
<td></td>
</tr>
<tr>
<td>Star Head (Torx®)</td>
<td>Positive-engaging, fast-locating method which transmits drive torque with less required downward pressure. Good fastening appearance.</td>
<td></td>
</tr>
<tr>
<td>Slotted</td>
<td>Accepts standard blade screwdriver. Requires less downward pressure to drive parts than those with recessed openings. Use a proper fitting blade to minimize slippage.</td>
<td></td>
</tr>
<tr>
<td>Security</td>
<td>These screws are impossible to remove without the special matching screw driver.</td>
<td></td>
</tr>
</tbody>
</table>

36686 - Thin head thumb screw

36687 - Thumb screw

36691 - Threaded captive washers

36692 - Retainer flanges

wixroyd.com
One option to retain screws to panels are our retaining washers. Used in place of retainer flanges, retaining washers are simple but effective when used with our captive screws. The captive screws have a normal thread then a reduced diameter for the rest of the screw length. The retaining washer has a small length of thread on the internal diameter and once screwed on to the captive screw is effectively captive.

Example

Screw the thin retaining washer onto the captive screw and the screw is therefore retained to the panel.
